shooting by Valentina Zitelli

What is TNG

- It is the “photocopy” of the NTT
- In this project we have the luxury that basic things have been sorted out by someone else (ESO) and we can focus on making fancy and strange modifications pretending to improve it...
- TNG has been the very first national project where everyone worked with, in perspective, a single target and a generation of people learn to develop instrumentation working as a single community

What is TNG

- It is the “photocopy” of the NTT

Adriano Maurizio

- In this project we have the luxury that basic things have been sorted out by someone else (ESO) and we can focus on making fancy and strange modifications pretending to improve it...

Favio (but we all called him Fabio) Bortoletto

- TNG has been the very first national project where everyone worked with, in perspective, a single target and a generation of people learn to develop instrumentation working as a single community

Flavio Fusi Pecci

Disclaimer

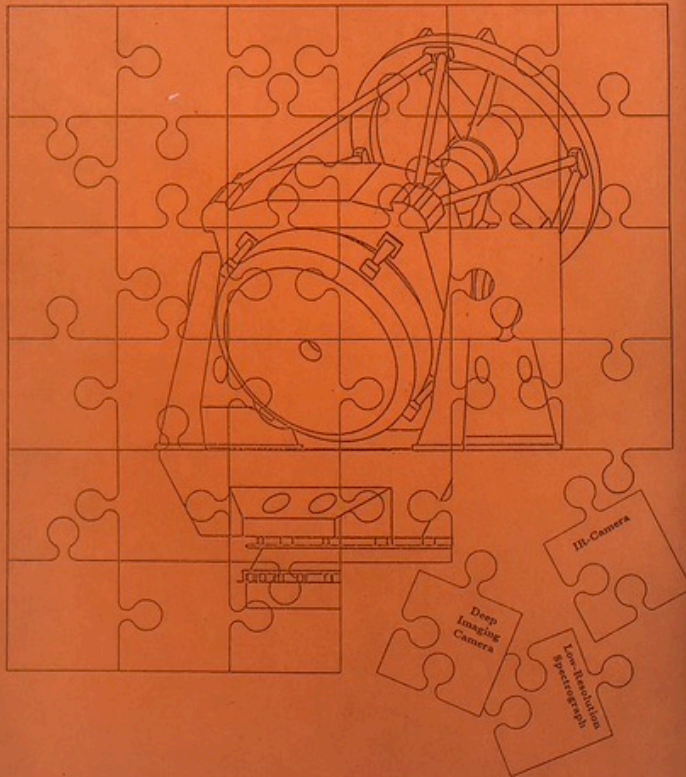

- I recollected notes, pictures, documents from that time...
- I would need a week or a month or maybe more more than what I estimated just to sort out everything...
- I have been impressed myself from the amount of novelties, innovations, nw paradigms that we were willing to inject into such a project...
- The following is a very partial and very personal point of view recollection of that wonderful times...
- I am pretty sure I missed to mention so much persons, episodes, and crazy or strange things we were willing to look at the sky through the new telescope named to our respected ancestor

Making it "with style"

The TNG heritage...

- No Prime Focus have ever seen the light at TNG
- But the studies and analyses found their way at LBT in the pair of LBCs
- Still today the two wide field cameras are the most science productive instruments aboard the LBT telescope

Active Optics

Disclaimer

- Active Optics has been the first really new and modern branch of optics that we have been faced to...
- It requires to look the problem on what for most of us was a new approach, forcing us to study control theory and to understand things like the Laplace transform...
- We basically entered into this new arena with the modesty of taking the energies to absorb from our ESO teachers (Lothar Noethe in primis)...
- And then we attacked it with the more modern approaches of multiple and parallel computing that at the time were on their initial phase of development...

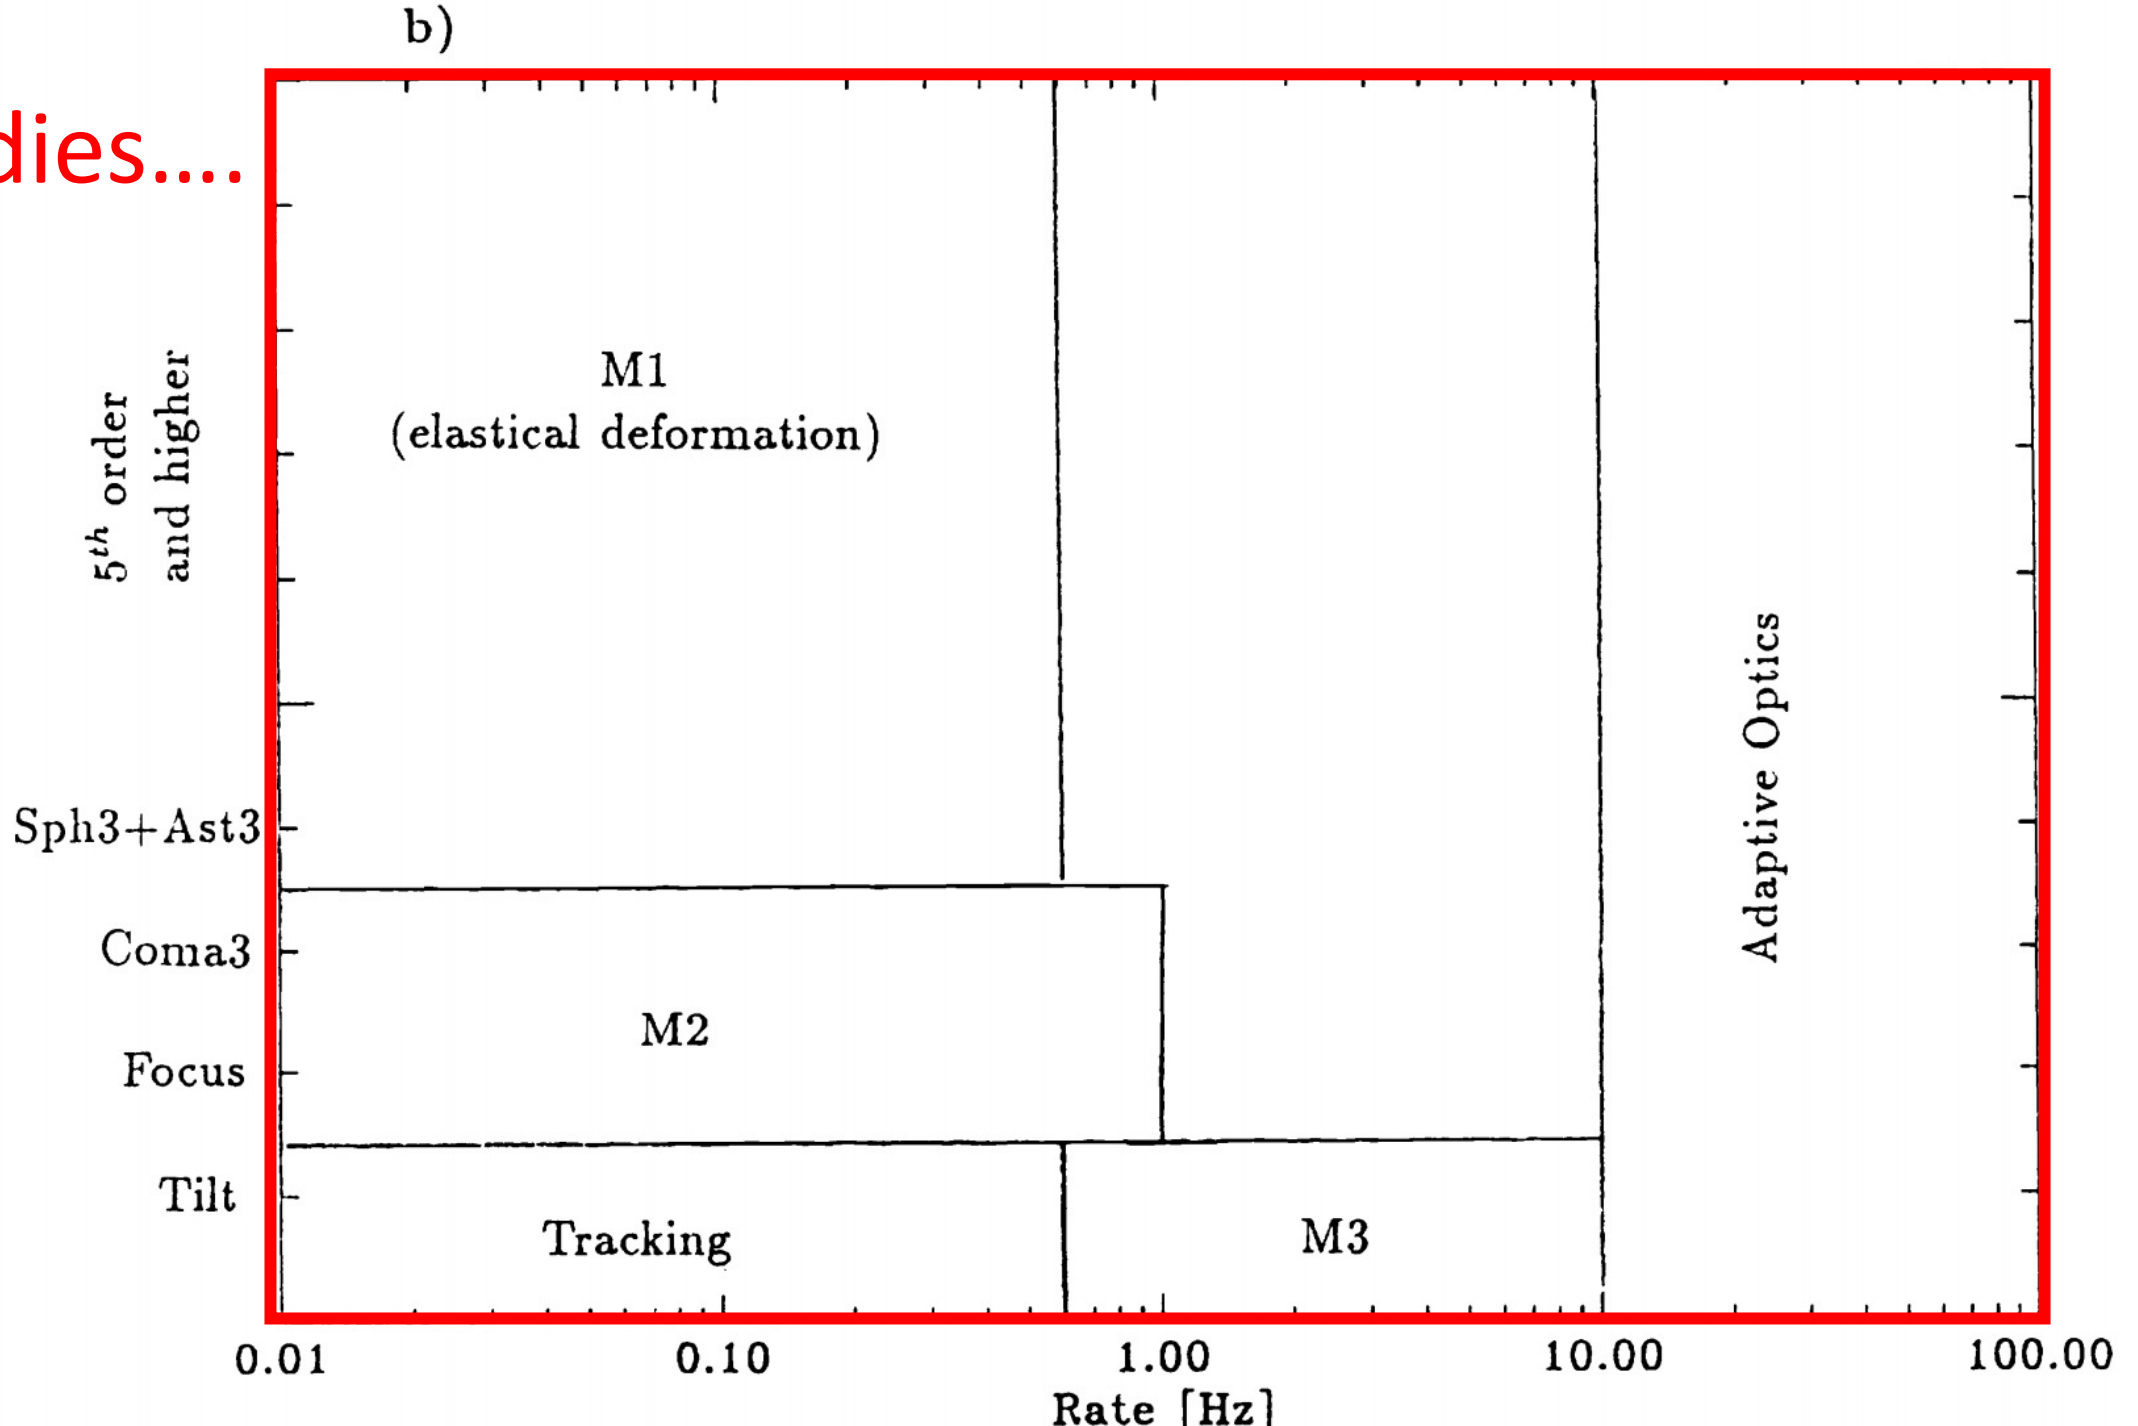

Causes....

Remedies....

Aligning the baby

Aligning the baby

- Basically you have to measure how much, in angle and displacement, in 3D, the axis are not in their nominal position...
- Acting on the (heavy) optical and mechanical components to minimize such departure...
- Keeping these figures for the pointing model...
- It is a combination of fine optical measurements and movement of really heavy (and fragile) pieces

Aligning the baby

- Dozens of stories...
- All the light for the Azimut has to go through a tiny aperture in the rotating joint
- Measurements inside the Azimuth box were made (mostly by myself and Fabio Bortoletto) lying over the cooling pipes leading to freezing in the meantime...
- I regret not having a picture with Francis Franza at ESO that spelled us so much tricks and hidden stories

Aligning the baby

Six legs for a mirror

Neutral points

a)

b)

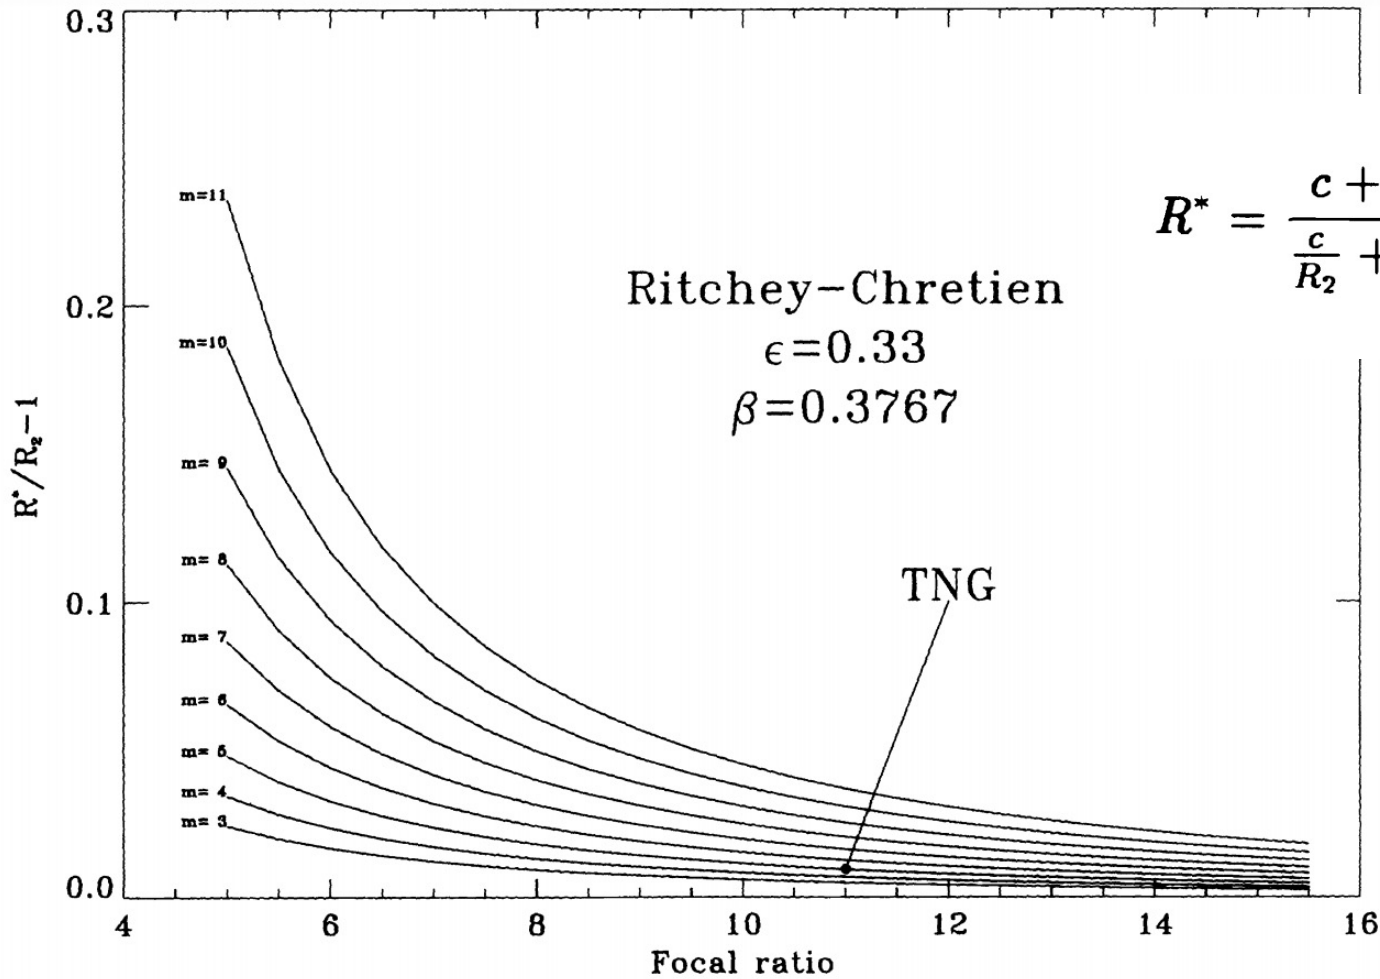

Figure 3: a: any rotation around a point displaced d from the optical axis is determined by the parameter ψ ; b: decentering coma and third-order offset depend upon d^* and d_w respectively.

Neutral points

$$R^* = \frac{c + q\gamma}{\frac{c}{R_2} + \frac{q\gamma}{R_w}} = R_2 \cdot \frac{1 - \frac{(m-1)(m+1)}{32F^2} \left(\frac{1-\epsilon^2}{1-\epsilon^4} \right)}{1 - \frac{(m-1)(m+1)}{32F^2} \left(\frac{1-\epsilon^2}{1-\epsilon^4} \right) \left[1 - K_2 \left(\frac{m-1}{m+1} \right) \right]}$$

Figure 4: Differences of R^* in respect to R_2 for a class of Ritchey-Chretien telescopes.

From drawings to reality

i-

And even the Germans at a WorkShop at ESO noted it...

The Conical “Constant”

Figure 6a: Scheme of the classical Hartmann test; Figure 6b: The modified scheme. The mask is projected onto the mirror and the returning spots are collected by plates located in various positions $P_2 \dots P_n$ spanning an l range. This is necessary because projecting the mask on the mirror the absolute calibration of the position of spots on the mirror is lost. This information can be gained through the knowledge of the angle θ via fitting straight lines on the spots collected by the different plates.

A New WaveFront Sensor

WaveFront Sensing

- At the time we started what we nicknamed AdOpt@TNG there was three major WaveFront sensors employed in similar systems:
 1. Shack-Hartmann WFS
 2. Shack-Hartmann WFS
 3. Shack-Hartmann WFS
- We built, used and learn how to treat one for the Active Optics business
- The only degree of freedom was the number of lenslet... 2x2, 4x4, 8x8 or 50...
- The largest the number of subaperture the best the correction but light being split into more channels would require a brightest reference star

WaveFront Sensing

Initially conceived just as a way to rearrange pixels in a “Shack-Hartmann-like” Wavefront Sensor, so that one can electronically choose the number of equivalent lenslets leading to a “flexible Shack-Hartmann”

A New WaveFront Sensor

A New WaveFront Sensor

A New WaveFront Sensor

A New WaveFront Sensor

A New WaveFront Sensor

An experimental PI XY fast stage we bought from... Vincenzo Piramide

WaveFront Sensing

Although our new concept attracted the attention of many, in and out the Country we realized it is also much more sensible than the ubiquitous Shack-Hartmann only four years later

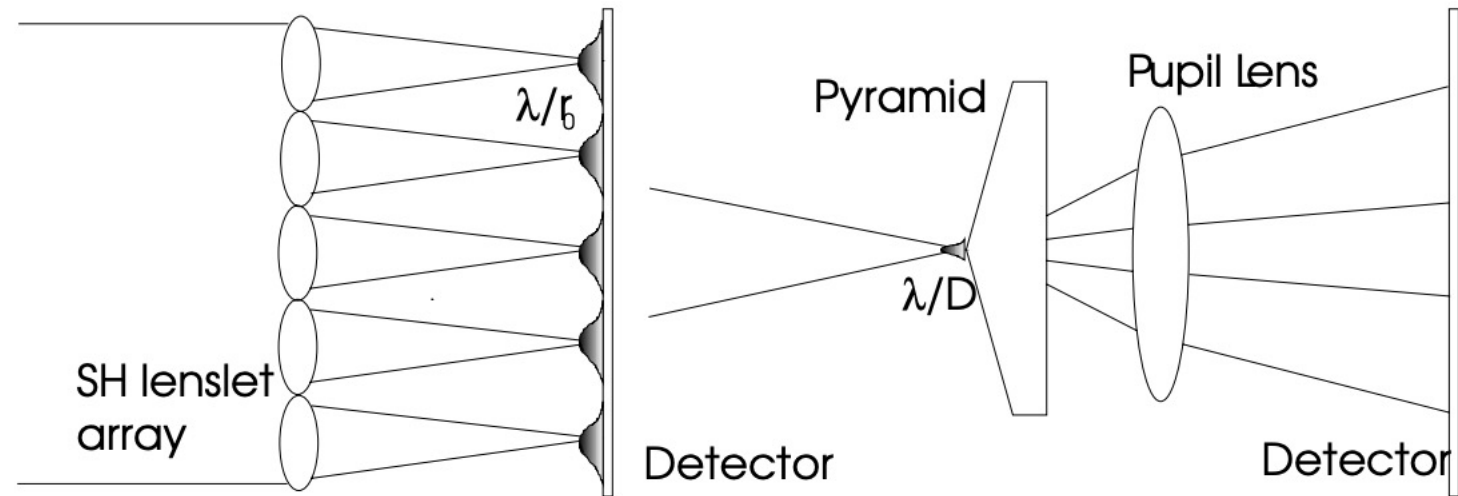

Fig. 1. The SH (left) and the pyramidic (right) WFS compared; both the WFS are shown in the perfectly close loop situation. When a tilt of the order of λ/D is introduced the efficiency of the pyramidic WFS is much larger because it acts *after* the recombination of the whole pupil light. In fact the movement of the spot is comparable to its size, while in the SH case all the spots will move of a fraction of their size.

From scratch....

...to (well...) finished parts...

And remember, we manufactured really everything....

In retrospective

- Even the LBT has been a conservative approach if you consider the innovations that was injected into TNG as differences wrt the NTT
- Surely there were layers where we were allowed to play and others where results must come in time (or nearly so...)
- We learn from a lot of people in ESO: Tarengi, Franza, Noethe, Wilson are just the one who I bothered more...
- Although it has been the first national challenge the arena was international (Jerry Nelson, Roger Angel, The brit for the poyinting)
- Most of the innovations should wait for a further bunch of years (and projects) to get maturity and recognition...
- Ideas grow around a project, if you can afford to allow them...
